Initial Model

Choose one or more design solutions or other factors from the list our class made. Record your choice here:

Which of the following best describes the way that the design solution(s) or factor(s) you chose will affect the outcome of a potential vehicle collision? You may choose more than one!

A. By preventing a collision (or making it more likely for a collision to occur)
B. By protecting people in the car (or making conditions more risky for people in the car)
C. By protecting people, animals, or the environment outside the car (or making conditions more risky for people, animals, or the environment outside the car)
D. Something else (please explain)

How could the design solution(s) or other factor(s) you chose affect the outcomes of vehicle collisions over time to create one of the patterns we recorded in class?
Use any combination of drawings, symbols, and/or words to explain how and why the solution(s) and/or factor(s) you chose might impact outcomes in a potential vehicle collision. Consider what happens in the system both before and during the event.
